January 6, 2020, London, UK: Aging Analytics Agency in collaboration with Gerontology Research Group (GRG) announces the publication of its open-access report, "[Supercentenarians Landscape Overview: Top-100 Living, Top-100 Longest Lived, Top-25 Socially and Professionally Active](#)".

The report is divided into four main sections:

- An introduction discussing records history and data on supercentenarians
- The 100 longest lived supercentenarians of all time, data, and profiles
- The 100 oldest currently living supercentenarians, data, and profiles
- The 25 currently living centenarians who remain professionally or socially active, data, and profiles

Analytical report finds valuable trends, such as gender distribution of supercentenarians, the geographic distribution of this group, and first-hand data on how they live their lives.

"The Gerontology Research Group (GRG) is pleased to collaborate with Aging Analytics Agency on this Supercentenarians Landscape Overview report, which provides both quantitative and qualitative perspectives on supercentenarians. The GRG brings more than 20 years of study experience on supercentenarians and has been the consultant to Guinness World Records on this issue for more than 19 consecutive years. This report presents supercentenarian data first as a population-group statistical overview, then the reader is introduced to nearly 200 supercentenarians (and 25 notable nonagenarians and centenarians noted for their healthy and active lifestyle) as key examples of maximum human longevity and healthy aging. It is the view of both Aging Analytics Agency and the GRG that scientific and general reader interest in the study of supercentenarians will continue to increase as key examples of healthy longevity and assessment of how long humans presently live and opportunities for future life extension. Data from supercentenarians continues to increase in availability from both established and emerging regions. Counter to past notions of supercentenarians as merely clustering in a few isolated regions, the updated worldview model based on GRG data shows that supercentenarians exist anywhere the population size and life expectancy are sufficient to support it. That is a positive for us all as it means that all groups have an opportunity to live to 110+, or at least to adapt the lifestyle practices of supercentenarians, as an attainable lifestyle goal" said Robert D. Young, Director, GRG Supercentenarian Research and Database Division.

"Aging Analytics Agency has been producing landscape overviews of both the Global Longevity Industry and related regional case studies for a number of years, long before mainstream recognition of this sphere was at the height that it is today. We are happy to collaborate on this new overview of the top longest-lived, currently living and socially and professionally-active supercentenarians with the long-standing leader in this field of research, documentation and validation, the Gerontology Research Group" said Franco Cortese, Director of Aging Analytics Agency.

In this fashion, Aging Analytics Agency's "[Supercentenarians Landscape Overview](#)" special analytical case study aims to give an overview of the history and data concerning the supercentenarian population as well as provide a more intimate look at the individuals who are possible supercentenarians, both those verified and recognized by the GRG and those still under investigation.

"There is no manner of conclusively knowing whether supercentenarians have existed throughout human history, or if they are a relatively recent phenomenon. We also do not know the roles that culture, environment or individual genetics might have played or how these factors could be interrelated. These gaps in our knowledge highlight the importance of not only accurate but also comprehensive data over multiple fields to fully be able to understand the phenomenon of extraordinary Longevity." - Supercentenarians Landscape Overview

In 1990, L. Stephen Coles, MD PhD created the Gerontology Research Group (GRG) which by 1997, for the first time, could verify and catalogue these claims in aggregate as a database. The GRG verifies that people claiming to be supercentenarians are at least 110 years old by validating proof of age documents provided by the claimant or their family. This report represents the latest, crucial research into the supercentenarian phenomenon, and will prove essential in the increasing awareness of the Longevity movement worldwide.

"The leadership and members of GRG appreciate the people of Aging Analytics Agency and their outstanding contributions with these landscape overviews. GRG, under Robert Young's (Director of Supercentenarian Research and Database) outstanding leadership, worked diligently to contribute solid information that meets Aging Analytics Agency's high standards and provides value." - Johnny Adams, GRG Executive Director, Aging Intervention Foundation CEO/Executive Director

GRG's mission is to slow and ultimately reverse age-related decline for more healthy years of life. Therefore, analyzing supercentenarians from as wide a data pool as possible is crucial for the growth and evolution of the global Longevity Industry.

About Aging Analytics Agency

Aging Analytics Agency is the world's premier provider of industry analytics on the topics of Longevity, Precision Preventive Medicine and Economics of Ageing, and the convergence of technologies such as AI, Blockchain, Digital Health and their impact on the healthcare industry, renowned for its development of sophisticated comparative analytical frameworks allowing for practical and tangible forecasts to be applied to industries that are otherwise too complex for standard analytical approaches to be used in a relevant way. The company provides strategic consulting services in fields relating to Longevity, and currently serves as the primary source of analytics and data for the UK All-Party Parliamentary Group for Longevity.
